

**Drying biomass without heat: Eliminate carbon emissions, save cost, improve quality**

Kevin Eichhorn, DRYMAX, USA

**ABSTRACT:**

While biomass and most industrial material has been dried with heat up to this point, DryMAX has invented a new way to remove water with RF energy and no heat. By substituting kW instead of BTUs, we can lower energy costs, eliminate emissions and radically redesign the way we approach product development, logistics and cost structures. DryMAX is developing large scale dryers for agriculture and industrial applications that defy 'old science', with no heat and modular design. Learn how we can help your company comply with energy savings, emissions reduction and overall better quality. DryMAX is looking for partnerships with governments, municipalities and corporations to reduce waste, material going to landfills and emissions goals.

**Biography:**

Kevin is the co-founder of DRYMAX, which has revolutionized the drying process for very energy intensive activities. He has 25 year's experience in leading and growing companies across many industries. He is an entrepreneur at heart who has the vision to jump ahead of the competition with a new idea, innovation, invention, marketing or collaboration. With experience in the CleanTech and Renewable Energy space, Kevin understood that drying is the key prohibitor of key projects, as well as the largest waste and cost factor in most industries. He grew up in Southern Africa helping his parents start schools and understanding economic development from the ground up. These principals propelled a desire to make a difference in anything he touched, from high school counselor to Director of a government agency, from growing development companies to driving change in the renewable energy sector. Recently, Kevin designed and engineered containerized renewable energy systems with his companies Tree2Energy and Seed2Diesel. He has worked in collaboration of technologies to consult on large scale MSW energy plants, scoping for best use of things that would normally be sent to a landfill.
